run_query.py — Market Discovery + Post-Enrich Pipeline (generic — works for ANY market query, not just one)

START
python run_query.py --query "<Market Name>" [--country <Country>]
(or --file markets.txt for batch mode)
[--mode/--profile/--cap] [--sections] [--seeds]

Load .env / validate settings
(LLM_PROVIDER key present, USE_MOCK_DATA=false)

Resolve mode / profile / cap
→ discover-cap & enrich-cap (works for bulk/standard/quality/full, any market)

Auto-load curated seeds + discovery queries
for this market's slug, IF a matching file exists
(queries/seeds/<slug>.txt) — optional, market-agnostic convention

PHASE 1 — Query Plan
LLM turns "<Market> | <Country> | sections" into a structured search/discovery plan (any market name is accepted as free text)

PHASE 2 — Discovery + Entity Gate
Search web/LLM for candidate companies for the plan; gate out non-entities / irrelevant hits

PHASE 3 — Enrichment
Pull website, HQ, founded year, employees, contacts, etc. for every candidate company (capped by enrich-cap)

PHASE 4 — Classification
Score + categorize companies into requested sections; apply quality/confidence filter

Export CSV + DOCX + JSON (+ optional FMCG XLSX)
to output/<slug>/ (slug = market + country, any market)

Channel-Purity Filter
Drop OEM / utility / non-channel rows using the market's inferred channel family (auto-detected — not hardcoded per market)

yes — loop to next query / next file line

--no-post-enrich passed?

yes

Push to Neon
if --push-neon / DATABASE_URL set

no

POST-ENRICH PIPELINE (steps 1-8, any market)

1 Gap-fill — Founded, HQ, leadership, contact pages
2 LinkedIn verify — confirm Founded + HQ
2b Wikidata fallback — fill Founded/HQ LinkedIn missed
2c Wikipedia infobox fallback — fill what's still missing
3 Apollo free search — contact_person only (no credits)
4 Upgrade partial/missing contact names (LinkedIn/Google/RocketReach)
5 Correct company / brand / domain + Key Brands Represented
6 Market-relevance audit — web search + LLM keep/review/remove
7 Refresh landscape Excel + Founded+HQ filtered Excel
8 Push upserts to Neon (companies / markets / metadata)

Save session-log entry
(query, country, rows exported, cost, elapsed)

Interactive: another query?
Batch: more lines in file?

no

END
(all queries / batch file lines processed)

Resumable at any point: --resume (post-enrich only, on an existing market folder) or --resume-checkpoint (reuse Phase 1/2, redo Phase 3/4).
